UNCERTAIN

SOURCE	STATUS	TECH	PUBLIC ENDPOINT
GitHub	● CONFIRMED	100%	github.com/octocat
Instagram	⦿ PROBABLE	78%	instagram.com/octocat
TikTok	◇ INCONCLUSIVE	-	tiktok.com/@octocat
Reddit	◆ BLOCKED	-	reddit.com/user/octocat
Telegram	⦿ PROBABLE	82%	t.me/octocat
Pinterest	○ NOT FOUND	-	pinterest.com/octocat

ANALYST NOTE

Username similarity and endpoint availability do not establish identity correlation. Probable findings require independent validation before attribution.

Trace Register

01 GitHub	● CONFIRMED 100%
REST user endpoint returned a matching public account. https://github.com/octocat	
02 Instagram	◉ PROBABLE 78%
Exact public URL and page markers were consistent; verification remains heuristic. https://www.instagram.com/octocat/	
03 TikTok	◇ INCONCLUSIVE -
Request resolved to an authentication wall; account state could not be established. https://www.tiktok.com/@octocat	
04 Reddit	◆ BLOCKED -
Public JSON endpoint returned HTTP 403 during the demonstration. https://www.reddit.com/user/octocat/	
05 Telegram	◉ PROBABLE 82%
Exact t.me endpoint responded with markers consistent with a public entity. https://t.me/octocat	
06 Pinterest	○ NOT FOUND -
No current public endpoint was identified in this demonstration. https://www.pinterest.com/octocat/	

Methodology & Limits

EXACT BY DEFAULT

NUVIAH evaluates the exact username first. Similar-username discovery is treated as a separate exploratory mode.

CONSERVATIVE CLASSIFICATION

HTTP 200 alone is not considered proof. Authentication walls, anti-bot responses and ambiguous pages are classified separately.

NO IDENTITY ATTRIBUTION

A matching username across multiple services does not prove that the accounts belong to the same person.

HISTORICAL EVIDENCE

Archived snapshots may support historical presence, but absence from an archive does not prove that a profile never existed.

INTERPRETATION RULE

Technical confidence describes the reliability of the detection method. It is not a probability that two accounts belong to the same person.
